

Bug	Level	Problem	What fixing it does
BUG-001	Medium	The local client startup script points to the wrong API port, so the app can appear broken even when the server is running.	Makes local testing and demos connect to the correct backend reliably.
BUG-002	Critical	Bad lead status requests can damage SLA tracking before the server returns an error.	Protects lead timelines and SLA reports from being corrupted by invalid requests.
BUG-003	High	The lead assignment endpoint crashes on valid assignment requests.	Lets managers assign/reassign leads without internal server errors.
BUG-004	High	API-key users are represented as "system" instead of a real user ID, which breaks database writes.	Allows approved integrations/service calls to write records with valid audit ownership.
BUG-005	High	Admin-created users can be given hidden temporary passwords that nobody receives.	Makes staff onboarding usable through proper invite/reset delivery.
BUG-006	High	Deleting a file removes the CRM record but may leave the actual uploaded file behind in storage.	Prevents sensitive documents from remaining accessible or billable after deletion.
BUG-007	Medium	The documented local admin credentials do not work against an existing local database.	Makes setup instructions trustworthy for QA and developers.
BUG-008	Medium	The client lint check fails with many errors.	Restores a quality gate that catches frontend mistakes before release.

Bug	Level	Problem	What fixing it does
BUG-009	Medium	The client ships a large main JavaScript bundle.	Improves load time and reduces performance risk for users on slower machines/connections.
BUG-010	Medium	API documentation generation warns about duplicate DTO names and may break on future framework upgrades.	Keeps API docs/startup stable and easier to maintain.
BUG-011	Medium	File upload failures can show raw provider/internal error messages.	Gives users safer, clearer errors without leaking system details.
BUG-012	Low	User statistics count a role called staff that does not exist.	Makes admin user metrics accurate.
BUG-013	Low	Server startup logs an unsupported wildcard-route warning.	Removes routing uncertainty and future framework breakage risk.
BUG-014	Critical	The restored data already contains many broken SLA-history records.	Makes SLA dashboards, escalations, and aging reports trustworthy again.
BUG-015	Medium	Quote and invoice status endpoints return server errors for invalid statuses instead of clean validation errors.	Prevents noisy 500s and gives users/API clients clear feedback.
BUG-016	Medium	Updating a user with no roles silently leaves their old roles in place.	Prevents admins from thinking they removed access when they did not.

Bug	Level	Problem	What fixing it does
BUG-017	Critical	Existing payments can be edited above the invoice total, creating overpaid invoices.	Protects accounting totals and stops finance data from being inflated.
BUG-018	High	Payments can be recorded against Draft invoices and change their lifecycle unexpectedly.	Ensures only proper issued/payable invoices can receive payments.
BUG-019	High	Scheduled jobs run automatically in local/dev and process restored production-like data.	Prevents accidental notifications/SLA mutations during local audits or demos.
BUG-020	High	A public calendar webhook can trigger sync work without implemented signature validation.	Prevents unauthenticated public requests from triggering expensive or risky sync operations.
BUG-021	High	Calendar/video integrations are shown as usable, but backend adapters are still stubs.	Stops users from relying on integrations that cannot actually complete the workflow.
BUG-022	High	Email template preview renders stored HTML without sanitizing it.	Reduces stored-XSS risk from malicious or unsafe template content.
BUG-023	High	Some payment summary fields do not match their allocation rows in restored data.	Makes payment allocation, installment, and reporting totals reconcile correctly.
BUG-024	Medium	Scheduling availability ignores the configured timezone.	Prevents bookings from appearing at the wrong local times.

Bug	Level	Problem	What fixing it does
BUG-025	Medium	Notification filtering uses the wrong field name.	Makes notification lists/filtering return the records users expect.
BUG-026	Medium	Duplicate contact emails and phone numbers exist in restored data.	Reduces duplicate outreach, confusion, and dirty CRM records.
BUG-027	Low	Some invoices show updated timestamps earlier than their created timestamps.	Improves audit/history accuracy and prevents confusing record timelines.
BUG-028	High	Applying payment terms concurrently can create duplicate schedules/child invoices.	Prevents duplicate installment plans and duplicate finance documents.
BUG-029	High	Dashboard aggregate endpoints are available to roles that should not see all-company metrics.	Protects management/finance visibility and aligns dashboard access with report permissions.
BUG-030	Medium	Notification preferences accept invalid event/channel/severity values.	Keeps notification settings clean and prevents unsupported preference states.
BUG-031	Medium	Discipline dashboard metrics still depend on fragile text matching for demos/proposals.	Makes activity metrics consistent and less sensitive to wording differences.
BUG-032	High	Public export contains helper scripts with fixed credentials and direct database mutation paths.	Reduces security and operational risk before sharing code externally.

Bug	Level	Problem	What fixing it does
BUG-033	High	Dependency audits report critical/high vulnerabilities in both apps.	Reduces known supply-chain/security exposure.
BUG-034	High	Sales reps can attach file metadata to arbitrary CRM records without checking access to the parent record.	Prevents users from linking files to records they should not control.
BUG-035	High	Operators can create cash requisitions against arbitrary leads/deals without ownership checks.	Prevents spend requests from being attached to the wrong customer/opportunity.
BUG-036	Medium	Reports UI shows finance/export actions to roles that the API rejects.	Prevents confusing dead-end buttons and failed report actions.
BUG-037	Medium	Dashboard Specific Date filter sends fields the backend ignores, so it shows month-to-date instead of one-day numbers.	Makes date-filtered dashboard numbers match the selected day.
BUG-038	Medium	Dashboard Product filter is visible but not applied by backend metrics.	Stops the UI from pretending metrics are product-filtered when they are not.
BUG-039	Medium	Demo dashboard metrics miss historical demo activity after moving to structured activity types.	Makes demo counts match real historical work or clearly labels the limitation.
BUG-040	High	Sales Performance undercounts cash collected because it reads invoice paid summaries instead of the payment ledger.	Makes cash-collected reports agree with actual payments received.

Bug	Level	Problem	What fixing it does
BUG-041	Medium	Multi-role sales manager/rep users see inconsistent self/team dashboard numbers.	Gives multi-role users one consistent dashboard/report view.
BUG-042	High	Submitting the same direct payment twice creates duplicate payment rows.	Prevents double-clicks/retries from inflating collections.
BUG-043	High	Paid or partially paid invoices can be cancelled, then payment edits can bring them back as paid/partial.	Makes cancellation a controlled state and stops cancelled invoices from re-entering revenue.
BUG-044	Critical	Deleting an invoice with payments deletes the payment records too.	Preserves financial history and prevents accounting evidence from being erased.
BUG-045	High	Duplicate payment-entry requests can both be approved into real payments.	Prevents approval-queue retries from becoming duplicate collections.
